

- Those two exercises are to practice procedure call and recursive call.

**Q1** : Write a MIPS assembly program for the following C program.

```
#include "math.h"
#include "stdio.h"

int add(int x, int y);
int msub(int x, int y);

int main() {
    int a = 0;
    int b = 0;
    int c = 0;
    int d = 0;
    printf("input a:");
    scanf("%d", &a);
    printf("input b:");
    scanf("%d", &b);
    printf("input c:");
    scanf("%d", &c);
    d = msub(add(a, b), c);
    printf("result = %d", d);
    return 0;
}

int add(int x, int y) {
    return x + y;
}

int msub(int x, int y) {
    int large = (x >= y) ? x : y;
    int small = (x <= y) ? x : y;
    while (large >= small) {
        large = large - small;
    }
}
```

```
    return large;
}
```

P.S. a, b, c, d are stored in \$s0, \$s1, \$s2, \$s3 respectively.

And you must use the procedure (function) call to implement add and msub.

Also, your program should terminal normally (the output should show "-- program is finished running --").

Output format example:

```
input a: 4
input b: 2
input c: 1
result = 0
-- program is finished running --
```

**Q2 :** Write a MIPS assembly program for the following C program.

```
#include "stdio.h"
int function(int x, int y);
int recursive(int x);

int main() {
    int a = 0;
    int b = 0;
    int c = 0;
    int d = 0;
    printf("input a: ");
    scanf("%d", &a);
    printf("input b: ");
    scanf("%d", &b);
    c = recursive(a);
    printf("ans: %d", c);
    d = function(b, c);
    printf("ans: %d", d);
    return 0;
}

int function(int x, int y) {
    if (x <= 0)
        return 1;
    else if (y <= 0)
```

```
        return 1;
    else
        return function(x - 1, y) + function(x, y - 1);
}
int recursive(int x) {
    return (x >= 0xFF) ? (recursive(x - 3) + recursive(x - 2))
        : ((x >= 0xF) ? recursive(x - 1) + 1 : 1);
}
```

P.S. a, b, c, d are stored in \$s0, \$s1, \$s2, \$s3 respectively.

And you must use the procedure (function) call to implement function and recursive.

Also, your program should terminal normally (the output should show "-- program is finished running --").

Output format example:

```
input a: 1
input b: 2
ans: lans: 3
-- program is finished running --
```

- **Submission** (2 assembly programs)

Please name your assembly program with your student ID, for example:

"arch\_hw3\_p1\_100000001.asm" & "arch\_hw3\_p2\_100000001.asm".

Use the iLMS (<http://lms.nthu.edu.tw/>) to submit your program.

- **Grading Criteria**

Correctness: 80%

Comment in program: 10%

Output format: 10%

嚴格禁止抄襲，抄襲者與被抄襲者一律 0 分！
